Practical 8

Model View Controller based PHP application development

1. Using MVC develop PHP application for online purchase of products. Create database to store product details and order details. Provide the product catalogue and order facility. Assume the user is registered and the data of the registration is stored in the user table. The user must login to place the order. The products can be viewed without logging in.
2. Extend the above programme to manage user sessions. Session should be managed from the point of the user login.
